**DESCRIPTION**

Contains Public Information
Adequate sedation and analgesia are important parts of many diagnostic and therapeutic procedures. Various levels of sedation and analgesia (anesthesia) may be used, depending on the patient’s condition and the procedure being performed. Monitored anesthesia care (MAC) refers to a set of physician services, not a particular level of sedation. The services include the ability to convert a patient to general anesthesia if needed and to intervene in the event that a patient’s airway becomes compromised.

**Background**

**Overview**

Monitored anesthesia care (MAC) is a set of anesthesia services defined by the type of anesthesia personnel present during a procedure, not specifically by the level of anesthesia needed. The American Society of Anesthesiologists (ASA) has defined MAC.\(^1,2\)

The following is derived from ASA statements:

"Monitored anesthesia care is a specific anesthesia service for a diagnostic or therapeutic procedure. Indications for monitored anesthesia care include the nature of the procedure, the patient’s clinical condition and/or the potential need to convert to a general or regional anesthetic.

Monitored anesthesia care includes all aspects of anesthesia care—a preprocedure visit, intraprocedure care, and postprocedure anesthesia management. During monitored anesthesia care, the anesthesiologist provides or medically directs a number of specific services, including but not limited to:

- Diagnosis and treatment of clinical problems that occur during the procedure
- Support of vital functions
- Administration of sedatives, analgesics, hypnotics, anesthetic agents or other medications as necessary for patient safety
- Psychological support and physical comfort
- Provision of other medical services as needed to complete the procedure safely.

Monitored anesthesia care may include varying levels of sedation, analgesia, and anxiolysis as necessary. The provider of monitored anesthesia care must be prepared and qualified to convert to general anesthesia when necessary. If the patient loses consciousness and the ability to respond purposefully, the anesthesia care is a general anesthetic, irrespective of whether airway instrumentation is required.

**Sedation Depth**

In 2004, ASA defined 4 levels of sedation/analgesia, as shown in Table 1.

ASA: American Society of Anesthesiologists.

Because sedation is a continuum, it is not always possible to predict how an individual patient will respond. Hence, practitioners intending to produce a given level of sedation should be able to rescue patients whose level of sedation becomes deeper than initially intended. Individuals administering moderate sedation or analgesia (conscious sedation) should be able to rescue patients who enter a state of deep sedation or analgesia, while those administering deep sedation or analgesia should be able to rescue patients who enter a state of general anesthesia.

**Sedation for Diagnostic and Therapeutic Procedures**

Multiple diagnostic and therapeutic procedures performed in the outpatient setting (eg, bronchoscopy, interventional pain management procedures) rely on some degree of sedation for anxiolysis and pain control. Regardless of sedation depth, sedation and anesthesia services provided in outpatient settings should be administered by qualified and appropriately trained personnel. Moderate sedation is generally sufficient for many diagnostic and uncomplicated therapeutic procedures. Moderate sedation using benzodiazepines, with or without narcotics, is frequently administered under the supervision of the proceduralist.

According to ASA’s standard for monitoring, MAC should be provided by qualified anesthesia personnel, including physicians and nurse specialists.2 By this standard, the personnel must be in addition to the proceduralist and must be present continuously to monitor the patient and provide anesthesia care. For patients at high risk of an unsuccessful procedure under moderate sedation, this allows for the safe continuation of the procedure under deep sedation or general anesthesia by trained personnel.

Moderate sedation can be achieved using pharmacologic agents for sedation, anxiolysis, and analgesia. A frequently used combination is an opioid and benzodiazepine (eg, fentanyl with midazolam) at doses individualized to obtain the desired sedative effect. Other combinations have also been used. While benzodiazepines and opioids can cause respiratory depression, effective reversal agents exist for both.
Propofol has increasingly been used to provide sedation for procedures. It is associated with a rapid onset of action and fast recovery from sedation. However, there have been concerns about potential adverse effects and safety when used by nonanesthesiologists. Propofol has the potential to induce general anesthesia, and there is no pharmacologic antagonist to reverse its action. When used as moderate sedation, propofol may be administered by anesthesia personnel or under the direction of the proceduralist. ASA has offered practice guidelines for the provision of sedation by nonanesthesiologists, stating that personnel must be prepared to respond to deep sedation and loss of airway protection should these complications inadvertently occur during sedation.\(^4\)

**Regulatory Status**

In October 1989, propofol Diprivan® (AstraZeneca) was first approved by the U.S. Food and Drug Administration (FDA) through the premarket approval process for the induction and maintenance of anesthesia. The current FDA-approved label for Diprivan® states that it is indicated for initiation and maintenance of monitored anesthesia care sedation, combined sedation and regional anesthesia, or intensive care unit sedation of intubated, mechanically ventilated patients (adults only). It is also approved for induction of general anesthesia in patients 3 years of age and older and maintenance of general anesthesia in patients 2 months of age and older.

There are many other FDA-approved medications for pain relief, anxiolysis, and sedation that may be used in outpatient sedation.

**POLICY**

A. Use of monitored anesthesia care may be considered **medically necessary** for bronchoscopy, interventional pain procedures, CT scans, MRIs, cardiac catheterization and PTCAs when there is documentation by the proceduralist and anesthesiologist that specific risk factors or significant medical conditions are present. Those risk factors or significant medical conditions include any of the following:

1. Increased risk for complications due to severe comorbidity (American Society of Anesthesiologists P3\(^*\) or greater)
2. Morbid obesity (BMI [body mass index] \(>40\) kg/m\(^2\))
3. Documented sleep apnea
4. Inability to follow simple commands (cognitive dysfunction, intoxication, or psychological impairment)
5. Spasticity or movement disorder complicating the procedure
6. History or anticipated intolerance to standard sedatives, such as:
   a. Opioid dependent
   b. Benzodiazepine dependent
7. Patients with active medical problems related to drug or alcohol abuse
8. Patients younger than 13 years or 70 years or older
9. Patients who are pregnant
10. Patients with increased risk for airway obstruction due to anatomic variation, such as:
    a. History of stridor
    b. Dysmorphic facial features
    c. Oral abnormalities (eg, macroglossia)
    d. Neck abnormalities (eg, neck mass)
    e. Jaw abnormalities (eg, micrognathia)
11. Acutely agitated, uncooperative patients

*American Society of Anesthesiologists' physical status classification system for assessing a patient before surgery:

   P1 – A normal, healthy patient
   P2 – A patient with mild systemic disease
   P3 – A patient with severe systemic disease
   P4 – A patient with severe systemic disease that is a constant threat to life
   P5 – A moribund patient who is not expected to survive without the operation
   P6 – A declared brain-dead patient whose organs are being harvested

B. Use of monitored anesthesia care is considered not medically necessary for bronchoscopy, interventional pain procedures, CT scans, MRIs, cardiac catheterization and PTCAs in patients at average risk related to use of anesthesia and sedation.

Policy Guidelines
This policy only addresses anesthesia services for diagnostic or therapeutic procedures involving bronchoscopy, and interventional pain procedures, CT scans, MRIs, cardiac catheterization and PTCAs performed in the outpatient setting.

Monitored Anesthesia Care
Monitored anesthesia care can be provided by qualified anesthesia personnel with training and experience in:

- Patient assessment
- Continuous evaluation and monitoring of patient physiological functions
- Diagnosis and treatment (both pharmacologic and nonpharmacologic) of any and all deviations in physiological function.

Procedural and Patient Risks
The Mallampati score is considered a predictor of difficult tracheal intubation and is routinely used in preoperative anesthesia evaluation. The score is obtained by having the patient extend the neck, open the mouth, and extend the tongue while in a seated position. Patients are scored from classes I through IV, as follows:

   Class I: The tonsils, uvula and soft palate are fully visible
Class II: The hard and soft palate, uvula and upper portion of the tonsils are visible
Class III: The hard and soft palate and the uvula base are visible
Class IV: Only the hard palate is visible

Patients with class III or IV Mallampati scores are considered to be at higher risk of intubation difficulty. While the Mallampati score does not determine a need for monitored anesthesia care, it may be considered in determining risk for airway obstruction. Other tests to predict difficult tracheal intubation include the upper lip bite test, the intubation difficulty scale, and the Cormack-Lehane grading system.

**RATIONALE**
This evidence review was updated with searches of the MEDLINE database. The most recent literature review was through October 6, 2016. Many recommendations for the indications for monitored anesthesia care (MAC) derive from narrative reviews and expert opinion. The following is a summary of the key literature to date.

**BRONCHOSCOPY**
No RCTs or nonrandomized comparative studies evaluating MAC versus non-anesthesiologist-administered sedation were identified. One RCT, published in 2009, addressed sedation in bronchoscopy but did not specifically address MAC. This trial, by Silvestri et al, compared 2 doses of the sedative agent fospropofol in patients undergoing diagnostic bronchoscopy; sedatives were administered by pulmonologists without anesthesia supervision. Patients (N=252) were randomized to induction doses of fospropofol 2 mg/kg or 6.5 mg/kg, followed by additional doses per protocol. All patients received a preprocedural dose of fentanyl. The primary end point was sedation success using the Modified Observer’s Assessment of Alertness/Sedation. The higher dose group had greater sedation success (88.7% vs 27.5%, respectively; p<0.001). Treatment success also favored the higher dose group (91.3% vs 41.25%, respectively; p<0.001). Adverse events were higher for the higher dose group (eg, the number of patients requiring any type of airway assistance) (33 [21.5%] vs 14 [13.6%], respectively). The trial did not compare alternate sedation approaches; that comparison would be necessary to evaluate the clinical value of the fospropofol sedation strategy for bronchoscopic procedures.

**Section Summary: Bronchoscopy**
There is a lack of published evidence on MAC in bronchoscopy procedures; no RCTs, nonrandomized comparative studies, or large case series were identified.

**INTERVENTIONAL PAIN MANAGEMENT**
In 2008, Bernards et al published a literature review on neurologic complications of regional anesthesia in anesthetized or heavily sedated patients. Some experts have postulated that the inability of a sedated patient to express atypical symptoms during a regional block may lead to increased risk of injury. No comparative studies have been done, and limited information is available from registries. The American Society of Regional Anesthesia and Pain Medicine has acknowledged the scarce and conflicting literature on the topic and recommended carefully weighing the risks and benefits of performing those procedures while the patient is heavily sedated or anesthetized.

Section Summary: Interventional Pain Management
There is a lack of published evidence on MAC in interventional pain management procedures; no RCTs, nonrandomized comparative studies or large case series were identified.

RISK FACTORS ASSOCIATED WITH ANESTHESIA OUTCOMES (MIXED INDICATIONS)
ASA has recommended that any location providing MAC have the capability of cardiopulmonary resuscitation and monitoring equipment. In 2004, Fleisher et al performed a retrospective claims data review on 564,267 outpatient surgical procedures: 360,780 at a hospital outpatient department, 175,288 at an ambulatory surgical center, and 28,199 at a physician's office. The rates of all-cause death, emergency department visits, and inpatient admissions within 7 days of the procedure were compared. The highest rates were seen among patients in the hospital outpatient surgery department, suggesting that patients evaluated to be at highest risk had their procedure in the location of lowest anesthesia risk. Multivariate analysis noted that increasing patient age, increasing procedural risk, and medical history of inpatient admissions were all independently predictive of adverse outcome. In 2013, Whippey et al published a case-control study of risk factors for unanticipated hospitalization following an outpatient procedure. They retrospectively identified 20,657 outpatient procedures and randomly selected 200 patients with an unanticipated hospitalization. These patients were compared to 200 randomly selected control patients without an unanticipated hospitalization. Predictors of unanticipated hospitalization included procedures lasting longer than 1 hour, high ASA physical status classification, older age, and higher BMI.

Pregnancy
Concerns about procedures and sedation during pregnancy are twofold: sensitivity of the fetus to the agents and/or procedural hypotension and maternal factors that increase sensitivity to sedation and that make intubation more difficult in an emergency situation. In a large (N=720,000) Swedish registry of pregnant patients from the 1970s and 1980s, 5405 operations took place. Congenital malformations and stillbirths were not increased in the offspring of women having surgery. Incidence of low birth-weight infants was increased as a result of both prematurity and intrauterine growth retardation. Neonatal death was also increased in patients who had surgery. No specific types of anesthesia or surgery were associated with these outcomes. The contribution of the underlying condition that led to the need for surgery could not be separated from the effects of the surgery or sedation/anesthesia.

Fetal heart rate monitoring is considered a more sensitive indicator of placental perfusion and fetal oxygenation than observations of maternal hemodynamic stability alone. The American College of Obstetricians and Gynecologists has recommended that use of intermittent or continuous fetal monitoring during surgery be individualized.

Physiologic changes in pregnancy may require changes in standard doses of anesthetic or sedative agents. However, propofol does not generally require a change in loading dose for induction. Physiologic changes in pregnancy may warrant MAC when airway protection becomes necessary, due to additional difficulties noted with emergent intubation in pregnant patients and the urgency to restore full oxygenation to the maternal and fetal patients.
Section Summary: Risk Factors Associated With Anesthesia Outcomes (Mixed Indications)
The available literature suggests that prolonged procedure, high ASA physical status classification, older age, higher BMI, and pregnancy are factors that increase risk associated with anesthesia. In these situations, MAC may be a reasonable option.

SUMMARY OF EVIDENCE
For individuals who have planned bronchoscopy and certain risk factors or significant medical conditions who receive MAC, the evidence includes no studies that directly address this issue. Relevant outcomes are overall survival, morbid events, hospitalizations, treatment-related mortality and morbidity. There is a lack of published evidence on MAC for bronchoscopy procedures; no RCTs, nonrandomized comparative studies, or large case series were identified. The evidence is insufficient to determine the effects of the technology on health outcomes.

For individuals who have planned interventional pain management procedures and certain risk factors or significant medical conditions who receive MAC, the evidence includes no studies that directly address this issue. Relevant outcomes are overall survival, morbid events, hospitalizations, treatment-related mortality and morbidity. There is a lack of published evidence on MAC for interventional pain management procedures; no RCTs, nonrandomized comparative studies, or large case series were identified. The evidence is insufficient to determine the effects of the technology on health outcomes.

PRACTICE GUIDELINES AND POSITION STATEMENTS
American Society of Anesthesiologists
In 2014, the American Society of Anesthesiologists (ASA) released an updated statement on the safe use of propofol:

“The Society believes that the involvement of an anesthesiologist in the care of every patient undergoing anesthesia is optimal. However, when this is not possible, non-anesthesia personnel who administer propofol should be qualified to rescue patients whose level of sedation becomes deeper than initially intended and who enter, if briefly, a state of general anesthesia.”

“Rescue” was defined as correcting “adverse physiologic consequences of the deeper-than-intended level of sedation (such as hypoventilation, hypoxia, and hypotension) and returns the patient to the originally intended level.”

In 2010, ASA updated a 2005 statement on anesthetic care during interventional pain procedures. While recognizing that some conditions may make skilled anesthesia care necessary, most minor pain procedures, under most routine circumstances, do not require anesthesia care other than local anesthesia.

British Thoracic Society
The 2013 British Thoracic Society guidelines on diagnostic flexible bronchoscopy in adults do not address monitored anesthesia care (MAC).
Society of Interventional Radiology
In 2013, the Society for Interventional Radiology (SIR) published a position statement responding to the ASA’s moderate sedation standards, specifically those on capnography. SIR did not include statements on MAC.

BENEFITS APPLICATION
BCBSKS will allow payment for monitoring of sedation services in an inpatient or outpatient facility when billed by an anesthesia provider capable of initiating general anesthesia should it be needed. BCBSKS will not allow payment for monitoring of sedation services in an office setting, with exception of those defined in K.S.A 40-2, 165.

CODING
The following codes for treatment and procedures applicable to this policy are included below for informational purposes. Inclusion or exclusion of a procedure, diagnosis or device code(s) does not constitute or imply member coverage or provider reimbursement. Please refer to the member’s contract benefits in effect at the time of service to determine coverage or non-coverage of these services as it applies to an individual member.

CPT/HCPCS
01920  Anesthesia for cardiac catheterization including coronary angiography and ventriculography (not to include Swan-Ganz catheter)
01922  Anesthesia for non-invasive imaging or radiation therapy

- For reference, the add-on code for anesthesia for patient of extreme age is 99100 – Anesthesia for patient of extreme age, younger than 1 year and older than 70 (List separately in addition to code for primary anesthesia procedure).
- For other medical conditions increasing the risk in requiring monitored or general anesthesia services for these procedures such as behavioral, dysmorphic, and neurological conditions, please attach Modifier-22 and submit medical records.

Those risk factors or significant medical conditions include any of the following:" to read "Use of monitored anesthesia care may be considered medically necessary for gastrointestinal endoscopy, bronchoscopy, interventional pain procedures, CT scans, MRIs, cardiac catheterization and PTCAs when there is documentation by the proceduralist and anesthesiologist that specific risk factors or significant medical conditions are present. Those risk factors or significant medical conditions include any of the following:"  
    • Revised Item A 1 to read "Increased risk for complications due to severe comorbidity (ASA P3* or greater)"
    • Revised Item A 2 to read "Morbid obesity (BMI [body mass index] >40)"
## REVISIONS

- Revised Item A 3 to read "Documented sleep apnea"
- Added Item A 4 "Inability to follow simple commands (cognitive dysfunction, intoxication, or psychological impairment)"
- Added Item A 5 "Spasticity or movement disorder complicating procedure"
- In Item A 6 removed "alcohol" and revised to read "History or anticipated intolerance to standard sedatives, such as:
  a. Opioid dependent
  b. Benzodiazepine dependent"
- Added Item A 7 "Patients with active medical problems related to drug or alcohol abuse"
- Revised Item A 8 to read "Patients younger than 13 years or 70 years or older"
- Revised Item A 9 to read "Patients who are pregnant"
- Revised Item A 10 to read "Patients with increased risk for airway obstruction due to anatomic variation including a history of such as:
  a. History of stridor
  b. Dysmorphic facial features
  c. Oral abnormalities (eg, macroglossia)
  d. Neck abnormalities (eg, neck mass)
  e. Jaw abnormalities (eg, micrognathia)"
- In Item A 12 added "gastrointestinal" and "(See Policy Guidelines)" to read "Prolonged or therapeutic gastrointestinal endoscopic procedures requiring deep sedation (See Policy Guidelines)"
- Added asterisk reference of "** American Society of Anesthesiologists (ASA) physical status classification system for assessing a patient before surgery:
P1 – A normal, healthy patient
P2 – A patient with mild systemic disease
P3 – A patient with severe systemic disease
P4 – A patient with severe systemic disease that is a constant threat to life
P5 – A moribund patient who is not expected to survive without the operation
P6 – A declared brain-dead patient whose organs are being harvested"
- In Item B added "bronchoscopy, interventional pain procedures" to read "Use of monitored anesthesia care is considered not medically necessary for gastrointestinal endoscopy, bronchoscopy, interventional pain procedures, CT scans, MRIs, cardiac catheterization and PTCA in patients at average risk related to use of anesthesia and sedation."
