State and Federal mandates and health plan member contract language, including specific provisions/exclusions, take precedence over Medical Policy and must be considered first in determining eligibility for coverage. To verify a member's benefits, contact Blue Cross and Blue Shield of Kansas Customer Service.

The BCBSKS Medical Policies contained herein are for informational purposes and apply only to members who have health insurance through BCBSKS or who are covered by a self-insured group plan administered by BCBSKS. Medical Policy for FEP members is subject to FEP medical policy which may differ from BCBSKS Medical Policy.

The medical policies do not constitute medical advice or medical care. Treating health care providers are independent contractors and are neither employees nor agents of Blue Cross and Blue Shield of Kansas and are solely responsible for diagnosis, treatment and medical advice.

If your patient is covered under a different Blue Cross and Blue Shield plan, please refer to the Medical Policies of that plan.
### DESCRIPTION

Several techniques have been developed to measure the thickness of the optic nerve/retinal nerve fiber layer (RNFL) as a method to diagnose and monitor glaucoma. Measurement of ocular blood flow is also being evaluated as a diagnostic and management tool for glaucoma.

### OBJECTIVE

The objective of this policy is to assess whether methods that evaluate the optic nerve and nerve fiber layer or that evaluate retinal blood flow improve health outcomes in individuals with glaucoma or who are suspected to have glaucoma.

### BACKGROUND

**Glaucoma**

Glaucoma is a disease characterized by degeneration of the optic nerve (optic disc). Elevated intraocular pressure (IOP) has long been thought to be the primary etiology, but the relationship between IOP and optic nerve damage varies among patients, suggesting a multifactorial origin. For example, some patients with clearly elevated IOP will show no optic nerve damage, while others with marginal or no pressure elevation will, nonetheless, show optic nerve damage. The association between glaucoma and other vascular disorders such as diabetes or hypertension suggests vascular factors may play a role in glaucoma. Specifically, it has been hypothesized that reductions in blood flow to the optic nerve may contribute to the visual field defects associated with glaucoma.

**Diagnosis and Management**

A comprehensive ophthalmologic exam is required for the diagnosis of glaucoma, but no single test is adequate for establishing the diagnosis. A comprehensive ophthalmologic examination includes an examination of the optic nerve by fundoscopy, evaluation of visual fields, and measurement of ocular pressure. The presence of characteristic changes in the optic nerve or abnormalities in visual field, together with increased IOP, is sufficient for a definitive diagnosis. However, some patients will show ophthalmologic...
evidence of glaucoma with normal IOPs. These cases of normal tension glaucoma (NTG) are considered to be a type of primary open-angle glaucoma (POAG). Angle-closure glaucoma is another type of glaucoma associated with an increase in IOP. The increased IOP in angle-closure glaucoma arises from a reduction in aqueous outflow from the eye due to a closed angle in the anterior chamber.

Conventional management of the patient with glaucoma principally involves drug therapy, to control elevated IOPs, and serial evaluation of the optic nerve to follow disease progression. Standard methods of evaluation include careful direct examination of the optic nerve using ophthalmoscopy or stereophotography, or evaluation of visual fields. There is interest in developing more objective, reproducible techniques both to document optic nerve damage and to detect early changes in the optic nerve and RNFL before the development of permanent visual field deficits. Specifically, evaluating changes in the thickness of the RNFL has been investigated as a technique to diagnose and monitor glaucoma. However, IOP reduction is not effective in decreasing disease progression in a significant number of patients, and in patients with NTG, there is never an increase in IOP. It has been proposed that vascular dysregulation is a significant cause of damage to the RNFL, and there is interest in measuring ocular blood flow as both a diagnostic and a management tool for glaucoma. Changes in blood flow to the retina and choroid may be particularly relevant for diagnosis and treatment of NTG. A variety of techniques have been developed, as described below.

Techniques to Evaluate the Optic Nerve and RNFL

Confocal Scanning Laser Ophthalmoscopy
CSLO is a laser-based image acquisition technique, which is intended to improve the quality of the examination compared with standard ophthalmologic examination. A laser is scanned across the retina along with a detector system. Only a single spot on the retina is illuminated at any time, resulting in a high-contrast image of great reproducibility that can be used to estimate the thickness of the RNFL. In addition, this technique does not require maximal mydriasis, which may be a problem in patients with glaucoma. The Heidelberg Retinal Tomography is probably the most common example of this technology.

Scanning Laser Polarimetry
The RNFL is birefringent, causing a change in the state of polarization of a laser beam as it passes. A 780-nm diode laser is used to illuminate the optic nerve. The polarization state of the light emerging from the eye is then evaluated and correlated with RNFL thickness. Unlike CSLO, SLP can directly measure the thickness of the RNFL. GDx is a common example of an SLP. GDx contains a normative database and statistical software package to allow comparison with age-matched normal subjects of the same ethnic origin. The advantages of this system are that images can be obtained without pupil dilation, and evaluation can be done in approximately 10 minutes. Current instruments have added enhanced and variable corneal compensation technology to account for corneal polarization.
**Optical Coherence Tomography**

OCT uses near-infrared light to provide direct cross-sectional measurement of the RNFL. The principles employed are similar to those used in B-mode ultrasound except light, not sound, is used to produce the 2-dimensional images. The light source can be directed into the eye through a conventional slit-lamp biomicroscope and focused onto the retina through a typical 78-diopter lens. This system requires dilation of the patient’s pupil. OCT is an example of this technology. OCT analysis software is being developed to include optic nerve head parameters with spectral domain OCT, analysis of macular parameters, and hemodynamic parameters with Doppler OCT and OCT angiography.

**Pulsatile Ocular Blood Flow**

The pulsatile variation in ocular pressure results from the flow of blood into the eye during cardiac systole. Pulsatile ocular blood flow can thus be detected by the continuous monitoring of IOP. The detected pressure pulse can then be converted into a volume measurement using the known relationship between ocular pressure and ocular volume. Pulsatile blood flow is primarily determined by the choroidal vessels, particularly relevant to patients with glaucoma, because the optic nerve is supplied in large part by choroidal circulation.

**Techniques to Measure Ocular Blood Flow**

A number of techniques have been developed to assess ocular blood flow. They include laser speckle flowgraphy, color Doppler imaging, Doppler Fourier domain OCT, laser Doppler velocimetry, confocal scanning laser Doppler flowmetry, and retinal functional imaging.¹

**Laser Speckle Flowgraphy**

Laser speckle is detected when a coherent light source such as laser light is dispersed from a diffusing surface such as retinal and choroidal vessels and the circulation of the optic nerve head. The varying patterns of light can be used to determine red blood cell velocity and retinal blood flow. However, due to differences in the tissue structure in different eyes, flux values cannot be used for comparisons between eyes. This limitation may be overcome by subtracting background choroidal blood flow results from the overall blood flow results in the region of interest.

**Doppler Ultrasonography**

Color Doppler imaging has also been investigated as a technique to measure the blood velocity in the retinal and choroidal arteries. This technique delivers ultrasound in pulsed Doppler mode with a transducer set on closed eyelids. The examination takes 30 to 40 minutes, and is most effective for the mean velocity of large ophthalmic vessels such as the ophthalmic artery, the central retinal artery, and the short posterior ciliary arteries. However, total blood flow cannot be determined with this technique, and imaging is highly dependent on probe placement.
**Doppler Fourier Domain OCT:** Doppler Fourier domain OCT is a noncontact imaging technique that detects the intensity of the light scattered back from erythrocytes as they move in the vessels of the ocular tissue. This induces a frequency shift that represents the velocity of the blood in the ocular tissue.

**Laser Doppler Velocimetry:** Laser Doppler velocimetry compares the frequency of reflected laser light from a moving particle to stationary tissue.

**Confocal Scanning Laser Doppler Flowmetry:** Confocal scanning laser Doppler flowmetry combines laser Doppler flowmetry with confocal scanning laser tomography. Infrared laser light is used to scan the retina, and the frequency and amplitude of Doppler shifts are determined from the reflected light. Determinations of blood velocity and blood volume are used to compute the total blood flow and create a physical map of retinal flow values.

**REGULATORY STATUS**

A number of confocal scanning laser ophthalmoscopy, scanning laser polarimetry, and optical coherence tomography (OCT) devices have been cleared by the U.S. Food and Drug Administration (FDA) through the 510(k) process for imaging the posterior eye segment. For example, the RTVue XR OCT Avanti™ (Optovue) is an OCT system indicated for the in vivo imaging and measurement of the retina, retinal nerve fiber layer, and optic disc as a tool and aid in the diagnosis and management of retinal diseases by a clinician. The RTVue XR OCT Avanti™ with Normative Database is a quantitative tool for the comparison of retina, retinal nerve fiber layer, and optic disk measurements in the human eye to a database of known normal subjects. It is intended for use as a diagnostic device to aid in the detection and management of ocular diseases. In 2016, the RTVue XR OCT with Avanti™ with AngioVue™ Software was cleared by FDA through the 510(k) process (K153080) as an aid in the visualization of vascular structures of the retina and choroid. FDA product code: HLI, OBO.

In 2012, the iExaminer™ (Welch Allyn) received marketing clearance by FDA through the 510(k) process. The iExaminer consists of a hardware adapter and associated software (iPhone® App) to capture, store, send and retrieve images from the Welch Allyn PanOptic™ Ophthalmoscope using an iPhone®. FDA product code: HKI.
POLICY

A. Scanning Laser Ophthalmoscopy (SLO) test is allowable for the diagnosis and the monitoring of the optic nerve, retinal conditions and glaucoma. Testing may be allowed every year. If the testing is done more frequently than every year, consultant review will be required.

B. Optical Coherence Tomography (OCT) test is allowed for the diagnoses, listed below, monitoring for retinal conditions, and ocular toxicity secondary to high-risk medications (ie, chloroquine [Aralen], hydroxychloroquine [Plaquenil], Interferon alpha-2b, Amiodarone, tamoxifen citrate [Nolvadex], fingolimod [Gilenya], Seroquel).

Repeat testing:
1. If Exudative Age-Related Macular Degeneration (AMD):
   Repeat OCT will significantly help guide the need for retreatment (with photodynamic therapy [PDT] or intravitreal injection treatments) in conjunction with intravenous fluorescein angiography (IVF) / indocyanine green (ICG). Maximum of 8 per year linked to intravitreal injections.

2. If Macular Drusen:
   Repeat annually, only if subjective visual changes or suspicion of choroidal neovascularization: if more than 2 studies per year, then documentation is required

3. If Diabetic Macular Edema (DME):
   Maximum of 8 per year linked to intravitreal injections or laser treatment.

4. If Retinal Detachment (RD):
   Repeat pre-treatment and post-surgical at 2 months (maximum of 2).

5. If Epiretinal Membrane (ERM):
   Repeat pre-treatment and post-surgical (maximum of 4 per year) if with macular edema.

6. If Macular Hole:
   Repeat pre-treatment and post-treatment (maximum of 4 per year) in cases of partially closed hole.

7. If Cystoid Macular Edema:
   Repeat every 2 months during acute treatment.

8. If Branch Retinal Vein Occlusion (BRVO):
   Maximum of 8 per year linked to intravitreal injections.
9. If Central Retinal Vein Occlusion (CRVO):
   Maximum of 8 per year linked to intravitreal injections.

C. OCT is also allowed for diagnosing and monitoring glaucoma, nerve fiber layer, and
   optic nerve conditions. Testing may be allowed every year. If the testing is done
   more frequently than every year, consultant review will be required.

RATIONALE
This policy has been updated regularly with searches of the MEDLINE database. The most recent
literature update was performed through January 25, 2017.

Assessment of a diagnostic technology typically focuses on 3 categories of evidence: (1) its
technical performance (test-retest reliability or interrater reliability); (2) diagnostic accuracy
(sensitivity, specificity, and positive and negative predictive value) in relevant populations of
patients; and (3) demonstration that the diagnostic information can be used to improve patient
outcomes. In addition, subsequent use of a technology outside of the investigational setting may
also be evaluated. These categories of evidence, although not always evaluated in sequence, can
be considered similar to the 4 phases of therapeutic studies.

The use of various techniques of retinal nerve fiber layer (RNFL) analysis (confocal scanning laser
ophthalmoscopy [CSLO], scanning laser polarimetry [SLP], optical coherence tomography [OCT])
for the diagnosis and management of glaucoma was addressed by 2 TEC Assessments (2001, 2
2003). Literature searches focusing on longitudinal results have been performed since the 2003
TEC Assessment.

Following is a summary of the key literature to date.

Imaging of the Optic Nerve and RNFL
Clinical Context and Test Purpose
The diagnosis and monitoring of optic nerve damage are essential for evaluating the progression
of glaucoma and determining appropriate treatment.

The question addressed in this policy is: Do imaging techniques for the optic nerve and RNFL
improve diagnosis and monitoring?

The following PICOTS were used to select literature to inform this review.

Patients
The relevant population is patients with glaucoma or who are suspected to have glaucoma being
evaluated for diagnosis and monitoring of glaucoma progression.

Interventions
The technologies of interest for assessment of the optic nerve and RNFL include CLSO, SLP, and
OCT. They are considered add-on tests to the standard clinical evaluation.
Comparators
There is no single criterion standard for the diagnosis of glaucoma. This diagnosis is made from a combination of visual field testing, intraocular pressure (IOP) measurement, and optic nerve and RNFL assessment by an ophthalmologist.

Outcomes
Relevant outcomes include the clarity of the images and how reliable the test is at evaluating the optic nerve and nerve fiber layer changes. Demonstration that the information can be used to improve patient outcomes is essential for determining the utility of an imaging technology. Although direct evidence on the impact of the imaging technology from controlled trials would be preferred, in most cases, a chain of evidence needs to be constructed to determine whether there is a tight linkage between the technology and improved health outcomes. The outcomes relevant to this policy are IOP, loss of vision, and changes in IOP-lowering medications used to treat glaucoma.

Timing
For patients with manifest glaucoma, the relevant period of follow-up is the immediate diagnosis of glaucoma. For patients with suspected glaucoma, longer term follow-up would be needed to detect changes in visual field or RNFL. Clinical utility might be demonstrated by a change in the management and reduction in glaucoma progression across follow-up.

Setting
Patients may be self-referred, referred by optometrists, or referred by a general ophthalmologist to a glaucoma specialist. These procedures can be performed in an ophthalmologist’s office.

Technical Performance
We did not identify studies reporting on the technical performance of imaging techniques for the optic nerve and RNFL.

Diagnostic Accuracy
In 2012, the Agency for Healthcare Research and Quality published a comparative effectiveness review of screening for glaucoma. Included were randomized controlled trials (RCTs), quasi-RCTs, observational cohort and case-control studies, and case series with more than 100 participants. The interventions evaluated included ophthalmoscopy, fundus photography or computerized imaging (OCT, retinal tomography, SLP), pachymetry (corneal thickness measurement), perimetry, and tonometry. No evidence was identified that addressed whether an open-angle glaucoma screening program led to a reduction in IOP, less visual impairment, reduction in visual field loss or optic nerve damage, or improvement in patient-reported outcomes. No evidence was identified on harms of a screening program. Over 100 studies were identified on the diagnostic accuracy of screening tests. However, due to the lack of a definitive diagnostic reference standard and heterogeneity in study designs, synthesis of results could not be completed.

A 2015 Cochrane review assessed the diagnostic accuracy of optic nerve head and nerve fiber layer imaging for glaucoma. Included were 103 case-control studies and 3 cohort studies (total N=16,260 eyes) that evaluated the accuracy of recent commercial versions of OCT (spectral domain), Heidelberg Retinal Tomograph (HRT) III, or SLP (GDx VCC or ECC) for diagnosing glaucoma. The population was patients who had been referred for suspected glaucoma, typically
due to an elevated IOP, abnormal optic disc appearance, and/or an abnormal visual field identified in primary eye care. Population-based screening studies were excluded. Most comparisons examined different parameters within the 3 tests, and the parameters with the highest diagnostic odds ratio were compared. The 3 tests (OCT, HRT, SLP) had similar diagnostic accuracy. Specificity was close to 95%, while sensitivity was 70%. Because a case-control design with healthy participants and glaucoma patients was used in nearly all studies, concerns were raised about the potential for bias, overestimation of accuracy, and applicability of the findings to clinical practice.

Effect on Health Outcomes
A technology assessment issued by American Academy of Ophthalmology in 2007 reviewed 159 studies, published between January 2003 and February 2006, evaluating optic nerve head and RNFL devices used to diagnose or detect glaucoma progression.6 The assessment concluded: “The information obtained from imaging devices is useful in clinical practice when analyzed in conjunction with other relevant parameters that define glaucoma diagnosis and progression.” Management changes for patients diagnosed with glaucoma may include the use of IOP-lowering medications, monitoring for glaucoma progression, and potentially surgery to slow the progression of glaucoma.

Section Summary: Imaging of the Optic Nerve and RNFL
Numerous studies and systematic reviews have described findings from patients with glaucoma using CSLO, SLP, and OCT. Although the specificity in these studies was high, it is likely that accuracy was overestimated due to the case-control designs used in the studies. The literature and specialty society guidelines have indicated that optic nerve analysis using CSLO, SLP, and OCT are established add-on tests that can be used with other established tests to improve the diagnosis and direct management of patients with glaucoma and those who are glaucoma suspects. Management changes for patients diagnosed with glaucoma may include the use of IOP-lowering medications, monitoring for glaucoma progression, and potentially surgery.

Evaluation of Ocular Blood Flow
Clinical Context and Test Purpose
The diagnosis and monitoring of optic nerve damage are essential for evaluating the progression of glaucoma and determining appropriate treatment. Measurement of ocular blood flow has been studied as a technique to evaluate patients with glaucoma or suspected glaucoma. The question addressed in this policy is: Do the techniques described below for assessing ocular blood flow improve diagnosis and monitoring? One potential application is the early detection of normal tension glaucoma.7

The following PICOTS were used to select literature to inform this review.

Patients
The relevant patient population is patients with glaucoma or suspected glaucoma who are being evaluated for diagnosis and monitoring of glaucoma progression. These tests may have particular utility for normal tension glaucoma (NTG).
**Interventions**
The technologies of interest for assessment of the optic nerve and optic nerve layer include color Doppler imaging (CDI), Doppler Fourier domain OCT, laser Doppler velocimetry, confocal scanning laser Doppler flowmetry, and retinal functional imager.

**Comparators**
There is no other criterion standard for the diagnosis of glaucoma. The diagnosis of glaucoma is made from a combination of visual field testing, IOP measurements, and optic nerve and RNFL assessment.

**Outcomes**
Relevant outcomes include the reliability of the test for evaluating ocular blood flow and the association between ocular blood flow parameters and glaucoma progression. Demonstration that the information can be used to improve patient outcomes is essential to determining the utility of a diagnostic technology. Although direct evidence on the impact of the imaging technology from controlled trials would be preferred, in most cases, a chain of evidence is needed to determine whether there is a tight linkage between the technology and improved health outcomes. The outcomes relevant to this policy are IOP, loss of vision, and changes in IOP-lowering medications used to treat glaucoma.

**Timing**
Longitudinal studies are needed to evaluate whether changes in blood flow are predictive of future visual loss.

**Setting**
Many of these procedures are performed with specialized equipment. While reports of use are longstanding (eg, Bafa et al [2001]8), investigators have commented on the complexity of these parameters9 and have noted that many of these technologies are not commonly used in clinical settings.10

**Technical Performance**
We did not identify studies reporting on the technical performance of ocular blood flow evaluation techniques.

**Diagnostic Accuracy**
In 2016, Abegao Pinto et al reported the results from the prospective, cross-sectional, case-control, Leuven Eye Study, which included 614 individuals who had primary open-angle glaucoma (POAG; n=214), NTG (n=192), ocular hypertension (n=27), suspected glaucoma (n=41), or healthy controls (n=140).11 The objective of this study was to identify the blood flow parameters most highly associated with glaucoma using technology commonly available in an ophthalmologist’s office or hospital radiology department. Assessment of ocular blood flow included CDI, retinal oximetry, dynamic contour tonometry, and OCT enhanced-depth imaging of the choroid. The glaucoma groups had higher perfusion pressure compared to controls (p<0.001), with lower velocities in both central retinal vessels (p<0.05), and choroidal thickness asymmetries. The NTG group, but not the POAG group, had higher retinal venous saturation compared to healthy controls (p=0.005). There were no significant differences in macular scans. The diagnostic accuracy or effects on health outcomes were not addressed.
A 2011 study reported on CDI in normal and glaucomatous eyes. Using data from other studies, a weighted mean was derived for the peak systolic velocity, end-diastolic velocity, and Pourcelot Resistive Index in the ophthalmic, central retinal, and posterior ciliary arteries. Data from 3061 glaucoma patients and 1072 controls were included. Mean values for glaucomatous eyes were within 1 SD of the values for controls for most CDI parameters. Methodologic differences created interstudy variance in CDI values, complicating the construction of a normative database and limiting its utility. The authors noted that because the mean values for glaucomatous and normal eyes had overlapping ranges, caution should be used when classifying glaucoma status based on a single CDI measurement.

Effect on Health Outcomes
The clinical utility of techniques to evaluate ocular blood flow is similar to the other imaging techniques. The objective is to improve the diagnosis and direct management of patients with glaucoma or suspected glaucoma. Measures of ocular blood flow may have particular utility for the diagnosis and monitoring of NTG.

The only longitudinal study identified was a 2012 study by Calvo et al on the predictive value of retrobulbar blood flow velocities in a prospective series of 262 who were glaucoma suspect. At baseline, all participants had normal visual field, increased IOP (mean, 23.56 mm Hg), and glaucomatous optic disc appearance. Blood flow velocities were measured by CDI during the baseline examination, and conversion to glaucoma was assessed at least yearly according to changes observed with CLSO. During the 48-month follow-up, 36 (13.7%) patients developed glaucoma and 226 did not. Twenty (55.5%) of those who developed glaucoma also showed visual field worsening (moderate agreement, κ=0.38). Mean end-diastolic and mean velocity in the ophthalmic artery were significantly reduced at baseline in subjects who developed glaucoma compared with subjects who did not.

Section Summary: Evaluation of Ocular Blood Flow
Techniques to measure ocular blood flow or ocular blood velocity are being evaluated for the diagnosis of glaucoma. Data for these techniques remain limited. Current literature focuses on which technologies are most reliably associated with glaucoma. Literature reviews have not identified studies whether these technologies improve the diagnosis of glaucoma or whether measuring ocular blood flow in patients with glaucoma or suspected glaucoma improves health outcomes.

SUMMARY OF EVIDENCE
For individuals who have glaucoma or suspected glaucoma who receive imaging of the optic nerve and retinal nerve fiber layer, the evidence includes studies on diagnostic accuracy. Relevant outcomes are test accuracy, symptoms, morbid events, functional outcomes, and medication use. Confocal scanning laser ophthalmoscopy (CSLO), scanning laser polarimetry (SLP), and optical coherence tomography (OCT) can be used to evaluate the optic nerve and retinal nerve fiber layer in patients with glaucoma and suspected glaucoma. Numerous articles have described findings from patients with known and suspected glaucoma using CSLO, SLP, and OCT. These studies have reported that abnormalities may be detected on these examinations before functional changes are noted. The literature and specialty society guidelines have indicated that optic nerve analysis using CSLO, SLP, and OCT are established add-on tests that may be used to diagnose and manage patients with glaucoma and suspected glaucoma. These results are often considered along with other findings to make diagnostic and therapeutic
decisions about glaucoma care, including use of topical medication, monitoring, and surgery to lower intraocular pressure. Thus, accurate diagnosis of glaucoma would be expected to reduce the progression of glaucoma.

For individuals who have glaucoma or suspected glaucoma who receive evaluation of ocular blood flow, the evidence includes association studies. Relevant outcomes are test accuracy, symptoms, morbid events, functional outcomes, and medication use. Techniques to measure ocular blood flow or ocular blood velocity are used to determine appropriate glaucoma treatment options. The data for these techniques remain limited. Literature reviews have not identified studies on the technical performance of these tests (eg, test-retest reliability), whether these technologies improve diagnostic accuracy, or whether they improve health outcomes in patients with glaucoma. Some have suggested that these parameters may inform understanding of the variability in visual field changes in patients with glaucoma, ie, they may help explain why patients with similar levels of intraocular pressure develop markedly different visual impairments. However, data on use of ocular blood flow, pulsatile ocular blood flow, and/or blood flow velocity are currently lacking.

**CLINICAL INPUT FROM PHYSICIAN SPECIALTY SOCIETIES AND ACADEMIC MEDICAL CENTERS**

While the various physician specialty societies and academic medical centers may collaborate with and make recommendations during this process, through the provision of appropriate reviewers, input received does not represent an endorsement or position statement by the physician specialty societies or academic medical centers, unless otherwise noted.

In response to requests, input was received from 1 physician specialty society and 3 academic medical centers while this policy was under review in 2009. Most reviewers supported use of these techniques (confocal scanning laser ophthalmoscopy, scanning laser polarimetry, optical coherence tomography) in the care of patients with glaucoma and those with suspected glaucoma suspect. Reviewers provided data to demonstrate that this testing is equivalent to expert assessment of optic disc photography for both detecting glaucoma and showing disease progression. Reviewers also commented on favorable aspects of this testing. For example, unlike other glaucoma testing, these tests can be done more easily (eg, testing does not always need to be done with dilated pupils) and ambient light level may be (is) less critical. In addition, while serial stereophotographs of the optic nerves are considered by many as the criterion standard, they are not always practical, especially for general ophthalmologists. This testing also requires less cooperation from the patient, which can help when evaluating some older patients.

**PRACTICE GUIDELINES AND POSITION STATEMENTS**

**American Academy of Ophthalmology**

The American Academy of Ophthalmology’s (AAO) 2015 primary open-angle glaucoma (POAG) suspect and POAG preferred practice patterns recommend evaluating the optic nerve and retinal nerve fiber layer.14,15

The documents state that “Although they are distinctly different methodologies, stereoscopic disc photographs and computerized images of the nerve are complementary with regard to the information they provide the clinician who must manage the patient.” The guidelines describe 3 types of computer-based imaging devices (CSLO, OCT, SLP) that are currently available for glaucoma, which are similar in their ability to distinguish glaucoma from controls and state that
“computer-based digital imaging of the ONH and RNFL is routinely used to provide quantitative information to supplement the clinical examination of the optic nerve... One rationale for using computerized imaging is to distinguish glaucomatous damage from eyes without glaucoma when thinning of the RNFL is measured, thereby facilitating earlier diagnosis and detection of optic nerve damage”. In addition, AAO concluded that, as device technology evolves the performance of diagnostic imaging devices is expected to improve.

**U.S. PREVENTIVE SERVICES TASK FORCE RECOMMENDATIONS**

Not applicable.

**ONGOING AND UNPUBLISHED CLINICAL TRIALS**

Some currently unpublished trials that might influence this review are listed in Table 1.

**CODING**

The following codes for treatment and procedures applicable to this policy are included below for informational purposes. Inclusion or exclusion of a procedure, diagnosis or device code(s) does not constitute or imply member coverage or provider reimbursement. Please refer to the member’s contract benefits in effect at the time of service to determine coverage or non-coverage of these services as it applies to an individual member.

**CPT/HCPCS**

- 92133  Scanning computerized ophthalmic diagnostic imaging, posterior segment, with interpretation and report, unilateral or bilateral; optic nerve
- 92134  Scanning computerized ophthalmic diagnostic imaging, posterior segment, with interpretation and report, unilateral or bilateral; retina
- 0198T  Measurement of ocular blood flow by repetitive intraocular pressure sampling, with interpretation and report

**ICD-9 Diagnoses**

**These diagnoses are subject to the medical policy as stated above**

- 115.02  Infection by Histoplasma capsulatum; retinitis
- 115.92  Histoplasmosis, unspecified; retinitis
- 190.6  Malignant neoplasm of eye; choroid
- 224.6  Benign neoplasm of eye; choroid
- 360.21  Degenerative disorders of globe; progressive high (degenerative) myopia
- 361.2  Serous retinal detachment
- 361.81  Traction detachment of retina

**REVISIONS**

<table>
<thead>
<tr>
<th>Date</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>04-19-2007 effective 07-01-2007</td>
<td>Added the indications for OCT use for diagnosing and monitoring glaucoma, nerve fiber, and optic nerve conditions.</td>
</tr>
<tr>
<td>05-09-2007 effective 11-01-2007</td>
<td>The policy section was updated to split the first bullet under B. to create two bullets, one for age-related macular degeneration and one for diabetic macular edema and to set a maximum number of OCT services per year for each.</td>
</tr>
</tbody>
</table>
| 04-30-2010 | In Policy Section:  
  - Revised repeat testing For Diabetic Macular Edema (DME), from “Repeat every 2 or 3 months” to “Repeat every 3 or 4 months”  
  - Revised repeat testing For Epiretinal Membrane (ERM) from “pre-treatment and post-surgical at 3 months, 6 months” to “pre-treatment and post-surgical after 6 weeks, 6 months”.  
  - Added "If Cystoid Macular Edema: Repeat every 2 months during acute treatment."  
  - Added "If Branch Retinal Vein Occlusion: Repeat every 3 or 4 months indefinitely."  
  - Added "If Central Retinal Vein Occlusion: Repeat every 3 or 4 months for approximately 2 years"  
  - Added "If Macular Drusen: Repeat annually, allowing one study by treating MD / OD per year."  
  - Corrected wording of "treating MD / OD" to "treating MD / DO" |
| In Coding Section:  
  - Updated wording for CPT code 92135.  
  - Confirmed no diagnosis codes listed for OCT for the rhegmatogenous retinal detachment (361.00-361.07)  
  - Added diagnosis code 362.51. |
| 10-26-2010 | In Policy Section:  
  - Item A, inserted ", retinal conditions" to read "Scanning Laser Ophthalmoscopy (SLO) test is allowable for the diagnoses and the monitoring of the optic nerve, retinal conditions, and glaucoma."  
  - Item B, #1 through #3, removed "by treating MD/DO" to read: 1. If Exudative Age-related Macular Degeneration (AMD): Repeat OCT will significantly help guide the need for retreatment (with photodynamic therapy [PDT] or intravitreal injections) in conjunction with intravenous fluorescein angiography (IVF) / indocyanine green (ICG). Maximum of 8 per year linked to |
intravitreal injections.

2. If Diabetic Macular Edema (DME): Repeat 3 or 4 months (maximum of 4 per year linked to intravitreal injections / or laser treatment.

3. If Retinal Detachment (RD): Repeat pre-treatment and post-surgical at 2 months (maximum of 2).

4. If Epiretinal Membrane (ERM): Repeat pre-treatment and post-surgical after 6 weeks, 6 months (maximum of 3) if with macular edema.
   - Item B, #7, replaced “indefinitely,” with “for approximately two years.” To read “Repeat every 3 or 4 months for approximately two years.”
   - Item B, #9, replaced “allowing one study by treating MD/DO per year” with “if subjective visual changes or suspicion of choroidal neovascularization: if more than two studies per year, then documentation is required” to read “Repeat annually, if subjective visual changes or suspicion of choroidal neovascularization: if more than two studies per year, then documentation is required.”

In the Medical Policy Title Section:
- Replaced "Scanning Laser Ophthalmoscopy (SLO) for Glaucoma and Optical Coherence Tomography (OCT) for Retinal Conditions" with "Scanning Computerized Ophthalmic Diagnostic Imaging Devices."

02-16-2011 In Coding section:
- Added CPT codes: 92133, 92134, 92227, 92228.
- Removed CPT code: 92135.

01-01-2012 In the Coding section:
- Removed HCPCS code: S0625

01-15-2013 In the Policy section:
In Item B, revised the following statement. "Optical Coherence (OCT) test is allowed for the diagnoses and the monitoring for retinal conditions." to "Optical Coherence (OCT) test is allowed for the diagnoses, listed below, monitoring for retinal conditions, and ocular toxicity secondary to high-risk medications (i.e., chloroquine [Aralen], hydroxychloroquine [Plaquenil], Interferon alpha-2b, Amiodarone, tamoxifen citrate [Nolvadex], fingolimod [Gilenya], Seroquel)."

In Coding section:
- Added Diagnosis codes: 362.57, 379.21, V58.69.

01-22-2013 Corrections were made to the Current Effective Date and the Revision Date section.

07-30-2013 In Policy section:
- Item B, 9 moved to become new #2.
- In new Item B, 2, inserted "only" to read "Repeat annually, only if subjective visual changes..."

In Coding section:
- Added ICD-10 Diagnosis codes (Effective October 1, 2014)

Updated Reference section.

04-28-2015 Updated Description section.
Added Rationale section.

In Coding section:
- Added 377.14 to ICD-9 Diagnosis codes
- Added H47.231-H47.233 to ICD-10 Diagnosis codes.

Updated References section.

08-19-2015 In Policy section:
- In Item B 3, added "8" and removed “Repeat every 3 or 4 months" and "4", to read "Maximum of 8 per year linked to intravitreal injections or laser treatment."
- In Item B 5, removed “after 6 weeks, 6 months”, and "3", to read "Repeat pre-treatment and post-surgical (maximum of 4 per year) if with macular edema."
- In Item B 6, removed “at 2 or 3 months” and added “maximum of 4 per year) in”, to read "Repeat pre-treatment and post-treatment (maximum of 4 per year) in cases of
- In Item B 8, removed "Repeat every 3 or 4 months for approximately 2 years" and added "Maximum of 8 per year linked to intravitreal injections"
- In Item B 9, removed "Repeat every 3 or 4 months for approximately 2 years" and added "Maximum of 8 per year linked to intravitreal injections"

Updated Rationale section.

Updated References section.

10-12-2016
Updated Description section.
Updated Rationale section.
Updated References section.

05-12-2017
Updated Description section.

In Policy section:
- In Item B, removed "diagnosis" and "and the" and added "diagnoses, listed below" and ",", and ocular toxicity secondary to high-risk medications (ie, chloroquine [Aralen], hydroxychloroquine [Plaquenil], Interferon alpha-2b, Amiodarone, tamoxifen citrate [Nolvadex], fingolimod [Gilenya], Seroquel)" to read, "Optical Coherence Tomography (OCT) test is allowed for the diagnosis diagnoses, listed below, and the monitoring for retinal conditions, and ocular toxicity secondary to high-risk medications (ie, chloroquine [Aralen], hydroxychloroquine [Plaquenil], Interferon alpha-2b, Amiodarone, tamoxifen citrate [Nolvadex], fingolimod [Gilenya], Seroquel)." (These revisions to policy language were inadvertently removed in the revision of 07-30-2013.)

Updated Rationale section.

In Coding section:
- Added CPT code: 0198T.
- Removed CPT codes: 92227, 92228.
- Added ICD-10 codes: H33.001, H33.002, H33.003, H33.011, H33.012, H33.013, H33.021, H33.022, H33.023, H33.031, H33.032, H33.033, H33.041, H33.042, H33.043, H33.051, H33.052, H33.053, H35.50, H35.51, H35.53, H35.54, H43.811, H43.812, H43.813, H47.031, H47.032, H47.033, H47.20, H47.211, H47.212, H47.213, H47.22, H47.291, H47.292, H47.293, H47.321, H47.322, H47.323, H47.331, H47.332, H47.333, H47.391, H47.392, H47.393.

In Revision section, revision date was changed from "01-15-2012" to "01-15-2013."
Updated References section.

10-01-2017
In Coding section:
- Added ICD-10 codes: H44.2A1, H44.2A2, H44.2A3, H44.2B1, H44.2B2, H44.2B3, H44.2C1, H44.2C2, H44.2C3, H44.2D1, H44.2D2, H44.2D3, H44.2E1, H44.2E2, H44.2E3.
